

α -800V Vacuum Glovebox

Vacuum Atmospheres Glovebox

Vacuum models of gloveboxes are complete standalone systems integrated with entire functional components. A vacuum can be produced in the glovebox chamber so that the purging process is much faster. They are able to create an inert environment with less than 1 ppm of H_2O and O_2 . The systems are modulated with antechambers, removable windows, adjustable trays, lighting units, adjustable shelves, and gloves, which meet most of the operational needs in the glovebox. The systems are made of welded stainless steel and are equipped with highest-quality components. We also provide optional components to meet your special requirements. The Vacuum models include a series of glovebox chamber lengths including 800, 1000, 1200, 1500, and 1800 mm. We also take custom-built orders according to your needs.

Application Notes & Warnings	• The interconnections between the glovebox chamber and the gas purification system must be unimpeded during the purification cycles • The use of corrosive gases is prohibited because they will damage the water and oxygen sensors • Regularly perform regeneration of gas purification columns to maintain the optimum purification efficiency • The O₂ removing rate is highly dependent on the type of purging gas used. To obtain faster chamber purging, Nitrogen is preferred to Argon due to its lighter molecular mass • Corrosive liquid (such as LiPF₆ solution) must be sealed in a container inside the glovebox. Otherwise, liquid vapor may condense and corrode the steel chamber and/or purification pipelines
